Abstracts

The global Lead-based Bearing Alloys market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Lead-based bearing alloys are also called lead-based babbitt alloys. It is a lead-antimony-tin-copper alloy, which has moderate hardness, good running-in performance, slightly larger friction coefficient, and low toughness. Mainly used for cables, batteries, etc. A bearing alloy based on lead and antimony. Its microstructure at room temperature is a soft matrix ? solid solution (solid solution of antimony dissolved in lead) distributed with hard point ? phase (solid solution of lead dissolved in antimony). In order to improve strength, hardness and wear resistance, 6% to 16% tin is usually added, and 1% to 2% copper is often added to prevent specific gravity segregation. In addition, adding a small amount of arsenic and cadmium can refine the structure and improve the high-temperature hardness of the alloy.

This report studies the global Lead-based Bearing Alloys production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Lead-based Bearing Alloys, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
