Abstracts

The global Lead Shielding Box market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A lead shielding box is a container made of lead, used for storing or transporting radioactive materials. The reason for using lead is because it is a dense material that can effectively block the radiation emitted by radioactive materials, thereby protecting people and the environment from the harmful effects of radiation. Lead shielding boxes are usually used in nuclear medicine, and radioisotopes are used in medical diagnosis and treatment. These isotopes release radiation and, if mishandled, may be harmful to human health. Therefore, lead shielding boxes are used to safely store and transport these isotopes. Lead shielding boxes come in different sizes and shapes, depending on the type and quantity of radioactive materials stored or transported. They are usually lined with additional materials such as plastic or rubber to further reduce the risk of radiation exposure. In addition to lead shielding boxes, other types of radiation shielding containers are also used, such as containers made of tungsten, steel, or concrete. The selection of materials depends on the specific requirements of the application and the characteristics of the radiation being shielded.
