According to our (Global Info Research) latest study, the global Lead Telluride Target Material market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Lead telluride target is a key material used in semiconductor thin film preparation technologies such as physical vapor deposition (PVD) and magnetron sputtering (sputtering). It is usually made of high-purity lead telluride (PbTe) material, which has good thermoelectric properties and chemical stability. In preparation technologies such as PVD and sputtering, the lead telluride target is placed in a vacuum chamber, and then the atoms on its surface are released by ion bombardment or thermal evaporation, and deposited on the surface of the semiconductor wafer to form the desired film structure. Due to the excellent thermoelectric properties of lead telluride, lead telluride targets have been widely used in the manufacture of semiconductor devices, such as for the preparation of thermoelectric materials, photodetectors, etc.
