Leaded aluminum electrolytic capacitors are aluminum electrolytic capacitors that utilize liquid electrolytes and are electrically connected through radial or axial leads. They are widely used in consumer electronics, industrial power supplies, household appliances, telecommunications equipment, automotive electronics, and new energy systems. These capacitors typically consist of anodized aluminum foil, cathode foil, separator paper, electrolyte, and an aluminum can enclosure. They are characterized by large capacitance values, cost efficiency, high ripple current capability, and mature manufacturing technology. They are primarily used for filtering, energy storage, coupling, bypassing, and power smoothing functions, making them one of the most widely adopted capacitor categories worldwide. In 2025, the global leaded aluminum electrolytic capacitor market is estimated at approximately USD4,680 million, with annual shipments of around 26 billion units, resulting in an average selling price of about USD0.18 per unit. The market is expected to grow at a CAGR of approximately 4.9% over the next five years. Typical single-line production capacity ranges from 300 million to 800 million units per year, while industry gross margins generally fall between 18% and 22%.
