Abstracts

The global Leaded Disk Varistors market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Leaded disk varistors are electronic components that are designed to protect circuits from overvoltage transients. They are small, disk-shaped devices made from a ceramic material that is doped with metal oxide. When a high voltage is applied to the disk, the metal oxide conducts current, effectively shorting out the transient voltage and preventing it from damaging the circuit.

Leaded disk varistors are widely used in a variety of electronic applications where protection against transient voltage spikes is required, such as in power supplies, consumer electronics, automotive electronics, and industrial equipment. They are available in a range of sizes and voltage ratings to suit different applications.
