Abstracts

The global Leak Detection Service market size is expected to reach \$ 1342 million by 2032, rising at a market growth of 5.8% CAGR during the forecast period (2026-2032).

Leak Detection Service refers to a specialized service provided by third-party service providers or professional operations and maintenance teams. Utilizing technologies such as acoustic detection, infrared thermal imaging, optical gas imaging, laser methane detection, ultrasonic testing, pressure/flow balancing, tracer gases, drone/aerial inspections, online sensors, and data analytics platforms, these experts identify, locate, quantify, and report leaks?while also providing alerts and maintenance recommendations?within pipelines or equipment systems carrying substances such as water, natural gas, petroleum, chemical media, compressed air, refrigerants, steam, and hydrogen. The core value of this service lies in mitigating safety incidents, environmental emissions, energy losses, downtime risks, and asset maintenance costs.

Leak detection is undergoing a transformation?shifting from manual inspections and periodic testing toward fixed sensors, continuous online monitoring, and remote platform-based services?a trend particularly evident in urban water supply systems, gas distribution networks, oil and gas pipelines, and large-scale industrial facilities. Hitachi?s water leak detection service utilizes permanently installed wireless vibration sensors and a dedicated monitoring platform to increase the frequency of pipeline inspections while reducing reliance on manual patrols. In the oil and gas sector, leak detection services are expanding beyond basic safety inspections to encompass methane emission monitoring, LDAR (Leak Detection and Repair), carbon emission compliance, and ESG data management. ChampionX?s Aerial Optical Gas Imaging platform has received validation for its methodology from the U.S. EPA, while Bridger Photonics has introduced drone-deployed Gas Mapping LiDAR, designed for use in complex

environments such as remote sites, offshore facilities, LNG terminals, and distribution networks. Across the water utility, construction, and industrial sectors, there is a growing emphasis on non-excavation and non-intrusive inspection methods; typical technologies in this category include acoustic correlation, ground-penetrating radar (GPR), in-pipe video inspection, infrared thermal imaging, and electromagnetic localization.
