In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

LED accelerated aging and life test system is a test method that simulates the worst environmental conditions that LEDs may encounter in actual applications, such as high temperature, high humidity, high current, etc., to accelerate the process of light decay and performance degradation, thereby predicting the life and reliability of LED lamps under actual use conditions. This test provides manufacturers with a basis for product design and improvement by obtaining LED performance degradation data in a shortened period of time. Its advantage is that it can efficiently evaluate the long-term performance of LED products, reduce the risk and cost of product launch, and guide users to better understand the life characteristics of products through accurate test data, thereby improving the market competitiveness of products and user satisfaction.
