Abstracts

According to our (Global Info Research) latest study, the global LED Lighting for Machine Vision market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

LED lighting is often specified by voltage but the brightness is actually determined by the current through the LEDs and not the supply voltage. This means that accurate control of light intensity requires good current control. LEDs are remarkably reliable devices but the light output reduces as the device ages and, in shorter timescale, the increase in temperature after the light is switched on will change the brightness. Switching the light on only when an image is being acquired by pulsing the light minimises the amount of heat produced and significantly improves LED lifetime. Strobing an LED light also brings the major benefit of allowing the light to be 'overdriven' to intensities much higher than the manufacturer's light rating.

The Global Info Research report includes an overview of the development of the LED Lighting for Machine Vision industry chain, the market status of Automotive (Spot Lights, Back Lights), Consumer Electronics (Spot Lights, Back Lights), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of LED Lighting for Machine Vision.
