Abstracts

The global LED Lighting for Machine Vision market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

LED lighting is often specified by voltage but the brightness is actually determined by the current through the LEDs and not the supply voltage. This means that accurate control of light intensity requires good current control. LEDs are remarkably reliable devices but the light output reduces as the device ages and, in shorter timescale, the increase in temperature after the light is switched on will change the brightness. Switching the light on only when an image is being acquired by pulsing the light minimises the amount of heat produced and significantly improves LED lifetime. Strobing an LED light also brings the major benefit of allowing the light to be 'overdriven' to intensities much higher than the manufacturer's light rating.

This report studies the global LED Lighting for Machine Vision production, demand, key manufacturers, and key regions.
