## Abstracts

According to our (Global Info Research) latest study, the global LED Photodynamic Therapy Device market size was valued at US\$ 437 million in 2024 and is forecast to a readjusted size of USD 813 million by 2031 with a CAGR of 9.1% during review period.

LED Photodynamic Therapy (PDT) Device is a medical apparatus that employs light-emitting diodes (LEDs) to emit precise wavelengths of light (commonly within the visible or near-infrared spectrum) to activate photosensitizing agents applied to targeted tissues. This interaction generates reactive oxygen species (ROS), which selectively destroy abnormal cells—such as cancerous growths, infected tissues, or acne-causing bacteria—while preserving surrounding healthy structures. The device integrates customizable parameters (e.g., wavelength selection, light intensity, treatment duration), safety mechanisms (temperature regulation, real-time monitoring), and user interfaces for controlled therapy delivery. Clinically utilized in dermatology (e.g., treating actinic keratosis, psoriasis), oncology, and aesthetic medicine, LED-PDT offers a minimally invasive, targeted approach with enhanced precision and reduced systemic side effects compared to traditional treatments.
