According to our (Global Info Research) latest study, the global Legged Robot market size was valued at USD 540.1 million in 2022 and is forecast to a readjusted size of USD 1322.5 million by 2029 with a CAGR of 13.6% during review period.

Legged robots are a type of mobile robot which use articulated limbs, such as leg mechanisms, to provide locomotion. They are more versatile than wheeled robots and can traverse many different terrains, though these advantages require increased complexity and power consumption. Legged robots often imitate legged animals, such as humans or insects, in an example of biomimicry.

Legged robots, or walking machines, are designed for locomotion on rough terrain and require control of leg actuators to maintain balance, sensors to determine foot placement and planning algorithms to determine the direction and speed of movement. The periodic contact of the legs of the robot with the ground is called the gait of the walker.

In order to maintain locomotion the center of gravity of the walker must be supported either statically or dynamically. Static support is provided by ensuring the center of gravity is within the support pattern formed by legs in contact with the ground. Dynamic support is provided by keeping the trajectory of the center of gravity located so that it can be repositioned by forces from one or more of its legs.

Legged robots can be categorized by the number of limbs they use, which determines gaits available. Many-legged robots tend to be more stable, while fewer legs lends itself to greater maneuverability.

Global 5 largest manufacturers of Legged Robot are Sony, UBTECH, Boston Dynamics, WEILAN and Leju, which make up over 68%. Among them, Particle Measuring Systems is the leader with about 28% market share. Asia-Pacific is the largest market, with a share about 57%, followed by North America and Europe, with the share about 24% and 12%.
