## Abstracts

According to our (Global Info Research) latest study, the global Lens Electron Microscope market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Lens electron microscope (LEM), also known as scanning electron microscope (SEM), is a microscope that uses a focused electron beam to create a detailed image of the sample surface. Unlike optical microscopes that use light waves to form images, LEM uses electrons with shorter wavelengths to achieve higher resolution imaging. In LEM, the electron beam is focused on the sample surface, resulting in secondary electron emission. These secondary electrons are then detected by the detector and used to form an image of the sample surface. The image can be enlarged and processed to provide detailed information about the surface structure, composition and morphology of the sample. It can deeply understand the microstructure and composition of materials, the shape and arrangement of cells and tissues, and the properties of various substances at the atomic and molecular levels.
