Abstracts

The global Leucomalachite Green market size is expected to reach \$ 12.58 million by 2032, rising at a market growth of 7.3% CAGR during the forecast period (2026-2032).

Leucomalachite Green is the reduced leuco form and main metabolite of Malachite Green. It is a colorless/light-colored triarylmethane dye, commonly sold as powder, analytical reference standards, certified reference materials, isotope-labeled internal standards, or small-volume formulated reagents. Its main uses are as a standard and quality control material for detecting Malachite Green and Leucomalachite Green residues in aquatic products. It can also be used in forensic science for presumptive blood testing through oxidative color development, as well as in analytical chemistry color reactions and toxicology research. The typical product gross margin is approximately 45%-60%.

Leucomalachite Green is a small-volume, high-unit-price specialty reagent with strong testing attributes. Market demand mainly comes from food safety testing, third-party testing laboratories, reference standard suppliers, research institutions, and a small number of forensic applications. This product is not a high-volume category in the traditional dye market. Actual procurement is mainly centered on residue analysis, method calibration, quality control validation, and color reaction research, so the market size is small but unit value is high.

From an application structure perspective, regulation of Malachite Green and its metabolite residues in aquatic products is the most stable demand source. Testing methods such as LC-MS and HPLC require Leucomalachite Green reference standards, certified reference materials, and isotope-labeled internal standards. The forensic field also uses its oxidative color development properties for presumptive blood

testing, but due to safety concerns, substitute reagents, and field operation protocols, this direction is more reflected in small-volume professional procurement rather than large-scale consumption.

Future growth will mainly come from normalization of food safety regulation, standardization of testing methods, higher laboratory quality control requirements, and increased demand for certified reference standards. Because Leucomalachite Green has certain toxicological risks, growth will not come from ordinary dyes, aquaculture drugs, or bulk chemical uses, but will concentrate in high-value niche products such as high-purity reagents, traceable reference standards, isotope-labeled internal standards, and forensic formulated reagents.
