Leukocyte Adhesion Deficiency (LAD) is a rare primary immunodeficiency disorder characterized by defects in leukocyte adhesion molecules, impairing the ability of white blood cells to migrate to sites of infection. Management of LAD involves a multifaceted approach, including early diagnosis, aggressive treatment of infections, and prophylactic antibiotic therapy to prevent recurrent bacterial infections. In severe cases, hematopoietic stem cell transplantation (HSCT) remains the only curative option and is often recommended for long-term survival. Emerging therapies such as gene therapy are also under investigation, particularly for specific subtypes of LAD. The overall goal of management is to improve immune function, reduce infection frequency, and enhance the patient's quality of life through timely and individualized treatment strategies.
