A level switch float is a device used to detect the level or fluid level of a liquid. It usually consists of a float and a switch connected to it. A float is a sealed hollow structure usually made of a highly buoyant material such as plastic or metal. The float floats in the liquid, and as the liquid level changes, the position of the float changes accordingly. A switch attached to a float is an electrical or mechanical device that triggers the switching action by the movement of the float. When the liquid level rises or falls, the float rises or falls accordingly, and when the float reaches the preset liquid level position, the switch will open or close.
