According to our (Global Info Research) latest study, the global Laser Sensors market size was valued at USD 1667 million in 2023 and is forecast to a readjusted size of USD 2168.4 million by 2030 with a CAGR of 3.8% during review period.

Laser sensors are used where small objects or precise positions are to be detected. They are designed as through-beam sensors, retro-reflective sensors or diffuse reflection sensors. Laser light consists of light waves of the same wave length with a fixed phase ratio (coherence).

These laser distance sensors use a focused, coherent light to measure distance to a target object. In factory automation applications, the target is usually a product or a machine element. They detect any solid object and produce an output proportional to the measured distance—independent of material, color and brightness.
