Abstracts

The global Light Diffusion Plate for Liquid Crystal Display market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The working principle of the light diffusion plate is to use chemical or physical means to use the physical imagination of refraction, reflection and scattering when the light encounters two media with different refractive indices on the way, so as to realize the full refraction and scattering of the light. It is widely used in liquid crystal display, LED lighting and imaging display systems.

The preparation methods of the light diffusion plate include the composite technology of extrusion molding and roller embossing, and the technology of preparing the light diffusion microstructure by hot embossing. Extrusion molding and roller embossing composite technology uses an extruder to manufacture PC sheets. At the same time, different types of light-diffusing particles can be added to the PC sheets to prepare light-diffusing sheets with different effects. The hot embossing method is to prepare a microstructure on the surface of the mold, and then transfer the microstructure on the surface to the surface of the polymer by embossing, and then shape it to obtain the required microstructure. The light diffusion plate is used to fully refract the light And scattering products have broad application prospects. According to the different materials used, it is divided into different types such as PMMA, PS, PET, PC light diffusion board, etc.
