## Abstracts

According to our (Global Info Research) latest study, the global Light Field Imaging & Display market size was valued at USD 160.4 million in 2023 and is forecast to a readjusted size of USD 204.7 million by 2030 with a CAGR of 3.5% during review period.

The light field is a vector function that describes the amount of light flowing in every direction through every point in space. The space of all possible light rays is given by the five-dimensional plenoptic function, and the magnitude of each ray is given by the radiance. Michael Faraday was the first to propose (in an 1846 lecture entitled 'Thoughts on Ray Vibrations') that light should be interpreted as a field, much like the magnetic fields on which he had been working for several years. The phrase light field was coined by Andrey Gershun in a classic paper on the radiometric properties of light in three-dimensional space (1936).

Light-field is an emerging concept for representing rich 3D visual information that is able to capture real world phenomena with unprecedented image quality. A light field describes visual information as a set of light rays that pass a (sensor / display) surface, but apart from capturing the position and color of each light ray, the direction of each light rays is also recorded. Both light-field cameras and light-field display exist in the market as of today (from Raytrix and Holografika, respectively). While light-field displays can reproduce hologram-like, full color, real time representations of anything that can be captured in light-field format, light-field cameras can capture 4D information of a subject, which can be used to reconstruct the depth of the recorded scene for every pixel, as well as to reconstruct all-in-focus images, all from a single shot.
