Light redirecting films can reduce the loss of edge regions of heterojunction solar cells. The optical design principles and designs behind light redirecting films are based on total internal reflection (TIR). It can use refraction in materials found in conventional solar modules to redeploy reflected sunlight onto the active portion of the solar cell. The front glass and EVA used in conventional modules have a refractive index of about 1.5, while the critical angle between the glass and air interface using TIR is 42° or higher.
