A light transmittance fog tester is a device used to measure the light transmittance and haze (turbidity) of materials. It typically consists of a light source, a sample stage, and a photodetector. By placing the sample between the light source and detector and measuring the transmitted light intensity and scattered light intensity, the light transmittance and haze of the sample can be calculated. This instrument is widely used in industries such as plastics, glass, and films for quality control and product performance evaluation.
