Abstracts

The light-controlled thyristor is also called the light-triggered thyristor, which uses a certain wavelength of light signal to replace the electrical signal to trigger the device. The volt-ampere characteristic of the light-controlled thyristor is the same as that of the ordinary thyristor, except that as the light signal becomes stronger, its forward turning voltage gradually becomes lower.

According to our (Global Info Research) latest study, the global Light Triggered Thyristor market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.
