## Abstracts

According to our (Global Info Research) latest study, the global Linear Alkylphenol market size was valued at US\$ 1320 million in 2025 and is forecast to a readjusted size of US\$ 1716 million by 2032 with a CAGR of 3.8% during review period.

Linear Alkylphenol (LAP) is an organic intermediate produced by the alkylation of phenol with linear olefins, typically derived from petrochemical feedstocks such as n-paraffins and ethylene. It serves as a key raw material for the production of nonionic surfactants, especially alkylphenol ethoxylates (APEOs) used in detergents, industrial cleaners, emulsifiers, textile processing agents, agrochemical formulations, and oilfield chemicals. In the supply chain, the upstream segment involves crude oil refining and steam cracking to produce benzene, propylene, and linear alpha-olefins, followed by phenol production via the cumene process and linear olefin production from paraffin dehydrogenation. The midstream stage consists of alkylation reactions (commonly using acid catalysts) to synthesize linear alkylphenols such as nonylphenol and octylphenol. The downstream segment includes the ethoxylation of alkylphenols to produce surfactants and specialty chemicals, which are widely used in detergents, coatings, lubricants, plastics additives, pesticides, and industrial cleaning formulations, although regulatory restrictions in some regions (e.g., EU) are gradually reducing their use due to environmental concerns. In 2025, global Linear Alkylphenol output was about 680,000 tons with 1.0 million tons of capacity, average prices of USD 1,700 ? 2,800 per ton, and gross margins around 17%.
