Linear Brake Spring is a mechanical component used in linear brakes to provide the necessary force for braking. It is a type of spring that is designed to be compressed when a force is applied to it, and then return to its original length when the force is removed. This action creates the necessary friction to slow down or stop the linear brake.

The upstream industry chain of Linear Brake Spring includes the production of raw materials such as steel, which is used to manufacture the spring. The downstream industry chain includes the assembly of linear brakes, which use the spring as a component.

In terms of the distribution of the product's world market share by region, it is difficult to provide an exact breakdown as it varies depending on the manufacturer and the specific industry in which the product is used.
