Abstracts

A linear clamper is a clamp used to hold the position of a table or stage during machining operations. It is directly attached to a linear guide and clamps to secure the position. Also known as a linear brake, these devices come in both pneumatically operated and manually lever-operated varieties.

While linear guides are commonly used in machining, traditionally, table movement has been controlled by attaching a stopper to the guide with bolts or using a balance cylinder to fix the guide. However, the former method requires time-consuming repositioning and manual installation, while the latter has limitations in terms of equipment size and accuracy. Linear clampers, which can be integrated into automatic control systems, offer compactness and precision in position control, addressing these issues.

According to our (Global Info Research) latest study, the global Linear Clamper market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
