According to our (Global Info Research) latest study, the global Linear Contact Displacement Sensor market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The "Linear Contact Displacement Sensor" is a sensor used to measure the displacement or displacement change of an object in a straight line direction. They determine the position through the contact between the object and the sensor, and convert this into an electrical output. These sensors usually use mechanical parts such as contacts, sliders or balls to contact the object under test, and as the position of the object changes, the position of the mechanical parts also changes, thereby changing the electrical output of the sensor.
