Abstracts

A linear gauge is a device used to measure the amount of displacement of an object to be measured.

It is used to measure the number of rotations of a shaft or to optically measure the amount of displacement of a device that is driven in a specific direction. It consists of a moving slit attached to the measurement target, two fixed slits, and a machine that counts the waveform of the slit as a pulse wave. The moving force of the measurement target is recognized as a pulse wave, and the degree to which the measurement target has moved by the number of waves can be measured. The measurement accuracy depends on the slit spacing.
