A Linear Lift is a type of conveyor system that enables people to move horizontally or on a slight incline over long distances. It is a variation of the traditional escalator but differs in its linear movement instead of vertical movement.

Linear Lifts consist of a series of interconnected platforms or steps that move along a continuous track. The track is typically a flat surface or a series of rollers that move the steps in a smooth and controlled manner. The steps are often made of durable materials like metal or rubber and are designed to provide secure footing for users. Linear escalators can operate at various speeds depending on their application and intended use. They are commonly found in airports, train stations, shopping malls, and other public areas where there is a need to transport people efficiently across large distances. One of the advantages of linear escalators is their ability to transport larger quantities of people compared to traditional escalators. They can accommodate individuals with luggage, shopping carts, or even people with mobility aids. Additionally, linear escalators improve convenience and reduce fatigue for users by providing continuous movement and eliminating the need to climb stairs or walk long distances. They can also enhance efficiency in crowded areas by optimizing the flow of foot traffic.
