## Abstracts

According to our (Global Info Research) latest study, the global Liposomes Drug Delivery market size was valued at USD 3431.8 million in 2023 and is forecast to a readjusted size of USD 6506.7 million by 2030 with a CAGR of 9.6% during review period.

Liposomes have been used to improve the therapeutic index of new or established drugs by modifying drug absorption, reducing metabolism, prolonging biological half-life or reducing toxicity. Drug distribution is then controlled primarily by properties of the carrier and no longer by physico-chemical characteristics of the drug substance only.

In a liposome drug product, the drug substance is contained in liposomes. Typically, water soluble drugs are contained in the aqueous compartment(s) and hydrophobic drugs are contained in the lipid layer(s) of the liposomes. Release of drugs from liposome formulations can be modified by the presence of polyethylene glycol and/or cholesterol or other potential additives in the liposome.

North America dominated the market with market share of 44% due to the high medical level. Following North America, Europe is the second largest market with market share of 36%. Asian Pacific regions are the third largest market with developed countries like Japan and many developing countries like China. Its market share is about 12%.
