Abstracts

The global Liquid Cooled General Purpose Server market size is expected to reach \$ 32980 million by 2029, rising at a market growth of 27.5% CAGR during the forecast period (2023-2029).

Market Drivers:

Data Center Expansion: The growing demand for data centers to support cloud computing, big data analytics, and online services is a major driver for general-purpose servers. These servers are the workhorses of data centers.

Virtualization: The adoption of server virtualization technology drives the need for more capable and versatile servers. General-purpose servers can host multiple virtual machines, optimizing resource utilization.

Cost-Efficiency: General-purpose servers are cost-effective compared to specialized servers. Businesses and organizations often prefer them for general computing tasks to maximize their IT budget.

Scalability: Many general-purpose servers are designed with scalability in mind, allowing businesses to start small and expand their IT infrastructure as their needs grow.

Market Restrictions:

Competition: The market for general-purpose servers is highly competitive, with many established and emerging manufacturers. This competition can put pressure on profit

margins and limit market share growth.

Specialized Workloads: For highly specialized workloads with unique requirements, such as high-performance computing (HPC) or graphics processing, general-purpose servers may not be the optimal choice.

Liquid cooled servers use working fluid as a medium for intermediate heat transfer to transfer heat from hot areas to distant locations for cooling. Since the specific heat of liquid is much greater than that of air, the heat dissipation speed is much greater than that of air, so the cooling efficiency is much higher than that of air cooling. Since the fan is omitted, the noise can also be reduced. Future generations of servers may require liquid cooling as air cooling capacity is exceeded.
