According to our (Global Info Research) latest study, the global Liquid Embolic Materials market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Liquid embolic materials are a kind of interventional treatment material widely used in the medical field. They mainly refer to a class of fluid-like preparations that are directly injected into the target tissue or blood vessel through a microcatheter to achieve the purpose of embolization, isolation or treatment of lesions. After injection, this type of material can react with water or other components in the blood, quickly precipitate and coagulate to form an embolism, thereby blocking the blood flow or blood supply to the lesion area. The main components of liquid embolic materials vary from product to product, but usually include embolic agents, solvents, and developers, etc. According to the different adhesion, liquid embolic materials can also be divided into two categories: adhesive liquid embolic materials and non-adhesive liquid embolic materials.

As an important part of the embolization therapy market, the market size of liquid embolic agents is expanding with the increase in the number of patients with vascular diseases. In particular, in the treatment of diseases such as neurovascular malformations, aneurysms, arteriovenous malformations and tumors, liquid embolic agents are used more and more widely. In addition, with the acceleration of the aging process of the population and the increase in the incidence of chronic diseases such as cardiovascular diseases and tumors, the demand for liquid embolic materials is also increasing. In particular, the incidence of diseases such as neurovascular malformations has increased year by year, further promoting the development of the liquid embolic agent market. In summary, the liquid embolic material market is in a rapid development
