Abstracts

According to our (Global Info Research) latest study, the global Liquid Nitrogen Cryo-grinder market size was valued at US\$ 134 million in 2024 and is forecast to a readjusted size of USD 203 million by 2031 with a CAGR of 6.1% during review period.

Liquid nitrogen cryo-grinder is an instrument for crushing and grinding samples in a low temperature environment. Liquid nitrogen cryo-grinder uses liquid nitrogen to cool the sample to an extremely low temperature (such as -196°C) so that the sample can be ground in a brittle state. Under low temperature conditions, the physical properties of the sample change, the internal stress decreases, and it is easy to break. At the same time, the low temperature can also prevent the sample from undergoing chemical reactions such as thermal decomposition and oxidation during the grinding process, thereby maintaining the original properties of the sample. Liquid nitrogen cryo-grinder is widely used in biology, medicine, food science, geology, and materials science. It is particularly suitable for samples that are difficult to grind at room temperature or are easily denatured due to thermal effects, such as animal and plant tissues, hair tissues, microorganisms, soil, rubber, plastics, and RNA and DNA in molecular biology experiments.
