Abstracts

According to our (Global Info Research) latest study, the global Liquid Oxygen (LOX) Transfer Pump market size was valued at US\$ 156 million in 2025 and is forecast to a readjusted size of US\$ 234 million by 2032 with a CAGR of 6.0% during review period.

Global shipments of liquid oxygen (LOX) transfer pumps are projected to reach approximately 38,000 units annually in 2025, with the average selling price worldwide ranging from \$3,000 to \$5,000 per unit. The average transaction price for mainstream industrial and medical-grade products is around \$4,000 per unit. This price range primarily corresponds to small-to-medium power industrial and medical-grade liquid oxygen transfer pumps, excluding aerospace-grade high-speed turbo cryogenic pumps or large-scale air separation unit-specific high-pressure cryogenic pumps. Major demand sources include large hospital liquid oxygen storage systems, small-to-medium-sized air separation units (ASUs), industrial gas filling stations, oxygen-enriched combustion systems in the steel metallurgy industry, and oxygen supply systems for the new energy and electronics industries. The European and American markets account for approximately 45%-50%, with the US, Germany, and Japan exhibiting high technological concentration in sealing structures and materials engineering. The Asia-Pacific region (China, India, and Southeast Asia) is experiencing rapid growth driven by industrial gas stations and new air separation unit investments. Liquid Oxygen (LOX) Transfer Pumps are specialized cryogenic pumps that operate in ultra-low temperatures down to -183°C, employing mechanical seals or shielded motors to prevent liquid oxygen leakage. Their core function is to provide stable and safe liquid transport and pressure boosting between liquid oxygen storage tanks and downstream vaporization, pressurization, or filling systems. Their engineering focus is not on ordinary cryogenic liquid transport equipment, but rather on safety-critical components in high-oxygen-

concentration, high-oxidation-prone environments. Compared to open or conventional cryogenic pumps, liquid oxygen (LOX) transfer pumps have higher standards in shaft seal structure, material oxidation resistance, fire and explosion protection design, and lubrication isolation structures, especially in the shaft seal area where any trace leakage and grease contamination risks must be avoided. With the advancement of distributed air separation unit deployments and the construction of medical oxygen supply infrastructure, this product is evolving from a 'cryo-assisted device' to a 'standardized safe transport unit.'

The core influencing factors of the liquid oxygen (LOX) transfer pump market do not depend on the cycle of a single industrial pump industry, but are closely related to the global investment scale in air separation, the construction of medical oxygen supply systems, and industrial gas demand. On the one hand, the steel and chemical industries maintain stable oxygen demand, driving demand for air separation units and related cryogenic pumps. On the other hand, the upgrading of liquid oxygen storage tanks in the medical system and the construction of regional gas stations create a stable replacement market. It is worth noting that this market exhibits a pattern where European, American, and Japanese companies have a high concentration in high-end sealing and materials technologies, while Chinese manufacturers possess economies of scale in engineering manufacturing and cost control. Future competition will revolve around sealing reliability, standardized production capabilities, and intelligent operation and maintenance capabilities, rather than simply price competition. Overall, this industry possesses characteristics of moderate and steady growth and high safety barriers, and its competitive essence is shifting from 'traditional mechanical manufacturing capabilities' to system-level capabilities in 'materials engineering and digital operation and maintenance capabilities.'
