Abstracts

The global Liquid Sodium Tert-butoxide market size is expected to reach \$ 32.05 million by 2032, rising at a market growth of 4.5% CAGR during the forecast period (2026-2032).

Liquid sodium tert butoxide refers to a product delivered in the form of a solution, usually dissolved in tert butanol, tetrahydrofuran, toluene or other organic solvents to form a homogeneous solution of a certain concentration. The common mass fraction is about 10% to 30% or indicated by molar concentration, such as 1.0 to 2.0 moles per liter; It belongs to strongly alkaline organic alkoxide solutions, with strong hygroscopicity, easy to react quickly with water and acid, and can react with carbon dioxide to generate carbonate impurities. Therefore, storage and use usually require sealed drying and under inert gas protection; Its main use is as a strong base and metalizing reagent in organic synthesis and fine chemical engineering, used in reaction steps such as deprotonation, condensation, etherification, and cyclization. Compared with the solid form, the advantage of the solution form is that the feeding is safer and more uniform, easy to measure and continuously feed, and can reduce the risk of dust and local heat release. However, the transportation and storage costs are usually higher, and the requirements for solvent compatibility and moisture control are stricter. In 2025, global Liquid Sodium Tert-butoxide production reached approximately 11.63 K MT, with an average global market price of around US\$ 1,965 per MT.

The annual production capacity of liquid sodium tert butoxide is 18 K MT, with a gross profit margin of about 20%.

The upstream mainly consists of tert butanol and sodium sources, with sodium sources mostly being metallic sodium. The supporting facilities also include solvent systems,

nitrogen or inert gases, desiccants and dehydration system consumables, closed metering and filling components, barrel or ton barrels and lining sealing materials, as well as hazardous chemical warehousing and transportation services.

The downstream mainly enters the synthesis of pharmaceutical and pesticide intermediates, fine chemicals and special materials synthesis, partial polymerization reactions and organometallic reaction systems. The customers are mostly pharmaceutical and chemical plants, agrochemical enterprises, fine chemical plants, reagents and distribution channels with anhydrous inert process capabilities. The liquid form is more preferred by continuous production and metering feeding scenarios.

The cost of raw materials usually accounts for 65% to 80% of the total cost, manufacturing expenses account for about 6% to 12%, packaging and hazardous chemical logistics account for about 8% to 18%, packaging and transportation distance have a significant impact on unit cost, quality inspection and document system account for about 3% to 6%, environmental safety and compliance and loss disposal account for about 2% to 6%, and management and sales account for about 3% to 7%.
