A liquid vacuum degasser is a device used to remove dissolved gases from liquids. Its working principle is primarily based on the physical property that gas solubility decreases under vacuum conditions. When the liquid is placed in a vacuum environment, the solubility of gases dissolved in the liquid (such as oxygen, nitrogen, carbon dioxide, etc.) decreases, causing gas molecules to escape from the liquid and form bubbles. These gas bubbles are then expelled through specific venting devices, thereby reducing the gas content in the liquid.
