According to our (Global Info Research) latest study, the global Lithium Aluminum Titanium Phosphate (LATP) Electrolyte market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Lithium aluminum titanium phosphate ($\text{Li}_{1.3}\text{Al}_{0.3}\text{Ti}_{1.7}(\text{PO}_4)_3$, LATP for short) is an inorganic solid electrolyte material with high ionic conductivity and good chemical stability. It is one of the research hotspots in the field of solid-state batteries. LATP belongs to the lithium ion conductor of NASICON (sodium superionic conductor) structure, and its three-dimensional framework structure is conducive to the rapid transmission of lithium ions. The general formula of NASICON structure is $\text{AM}_2(\text{PO}_4)_3$, where A is an alkali metal or alkaline earth metal, and M is a transition metal or rare earth metal. In the study, through appropriate element doping, the ionic conductivity of LATP can reach 1 millisiemens, which has good application prospects. At the same time, researchers are also exploring how to improve the interface stability between LATP and lithium metal by means of interface modification, surface coating, etc., in order to achieve better performance in all-solid-state batteries. Although LATP has many advantages, it still faces many challenges in the engineering process of all-solid-state lithium batteries, such as raw material development, battery cell design, and production process.
