Abstracts

According to our (Global Info Research) latest study, the global Lithium Battery Vacuum Drying Machine market size was valued at US\$ 357 million in 2024 and is forecast to a readjusted size of USD 558 million by 2031 with a CAGR of 6.6% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

In the production and manufacturing of lithium batteries, if the moisture cannot be handled well, the water in the battery will be flammable and explosive, posing a great threat to the safety of the battery and the whole vehicle. Therefore, dehydration becomes a key point in the manufacturing process of power batteries.

According to existing technologies, attached moisture and adsorbed moisture are relatively easy to drain. The most difficult to absorb is combined moisture, also known as crystal water. It needs to be adsorbed by high temperature in a high vacuum state. The higher the temperature and the higher the vacuum degree, the higher the drying efficiency. This report focuses on vacuum drying equipment.

From the perspective of structure, the current drying equipment mainly includes tunnel furnace drying furnace, single-unit drying furnace and combined drying furnace. Among them, the tunnel furnace drying method is suitable for single battery batch production; the single-machine combined drying furnace is more flexible, and the demand gradually increases with the different battery varieties. From the perspective of heating methods, there are mainly air transport, contact and other heating methods.

With the advent of the TWh battery era, higher equipment capacity, smaller equipment footprint, more energy-saving large-scale production, lower operating costs and more convenient maintenance have gradually become new demands of battery companies for equipment.
