Abstracts

The global Lithium Foil market size is expected to reach \$ 3375 million by 2032, rising at a market growth of 7.1% CAGR during the forecast period (2026-2032).

Global lithium foil sales reached 56,343 tons in 2025, with an average price of US\$36,142 per ton.

Lithium is extremely soft and the lightest metal out of the 103 metallic elements (specific gravity 0.5). Silver-white in color, lithium reacts strongly with water and even at room temperature turns black when exposed to nitrogen. The foil is wrapped into a coil and packed in an inert gas state when shipped.

The raw material for lithium foil is 'high-purity metallic lithium.' Industrially, it typically starts with battery-grade lithium ingots with a purity of 99.9%. Impurities such as sodium, potassium, calcium, and iron are first reduced to 15ppm through vacuum distillation or zone melting, and then cold-rolled to 200µm under argon protection. Lithium ingot costs account for 65-70% of the total foil cost, and the low yield of rolled products (60-70%) is another major cost item.

Cost Structure: High-purity lithium ingots 65-70%, electricity and argon protection 10%, roll wear and equipment depreciation 8%, labor and quality inspection 7%, packaging, transportation, and gross profit 5-10%. The current processing fee for 20µm ultra-thin foil is approximately 40-50 RMB/kg; the processing fee increases exponentially with thinner thickness and wider width.

This report studies the global Lithium Foil production, demand, key manufacturers, and key regions.
