Abstracts

According to our latest research, the global Lithium-Ion Storage System EPC market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Lithium-ion storage system EPC (Engineering, Procurement, and Construction) refers to an integrated service model of engineering, procurement and construction. In the application of lithium-ion energy storage systems, EPC usually involves the following three main stages:

- 1. Engineering:** This stage mainly includes the overall design of the lithium-ion energy storage system, the formulation of technical solutions, system configuration optimization, and related engineering design work. Factors that need to be considered in the engineering stage include the scale of the energy storage system, application scenarios, safety, efficiency, cost, and compatibility with the power grid.
- 2. Procurement:** In this stage, the EPC contractor will purchase equipment and materials according to the specific needs of the engineering design. For lithium-ion energy storage systems, the procurement content mainly includes key components such as lithium-ion battery cells, battery management systems (BMS), energy management systems (EMS), converters (PCS), battery racks, cables, and other related auxiliary equipment and materials.
- 3. Construction:** The construction stage refers to the process of actually building the designed lithium-ion energy storage system, including civil engineering, equipment installation, electrical connection, system debugging, trial operation, etc. This stage requires ensuring that all components are correctly installed according to the design

requirements and ensuring the safe and reliable operation of the entire energy storage system.

The characteristic of the EPC of the lithium-ion energy storage system is that the contractor is responsible for the entire process from design to construction of the project. The owner only needs to connect with the EPC contractor, which simplifies the project management process and improves the efficiency of project implementation. The EPC model is widely used in various infrastructure construction projects around the world, including new energy power generation, energy storage systems, etc.
