## Abstracts

On a network, servers and nodes typically have limited computing and storage capabilities. Due to unbalanced traffic forwarding, some servers and nodes may be overloaded while others are relatively idle. This reduces the network's computing and storage capabilities and can lead to a single point of failure. In order to maximize the utilization of these capabilities of servers and nodes while ensuring the stability and security of the system, load balancing is introduced. This report studies routers with load balancing capabilities.

According to our (Global Info Research) latest study, the global Load Balance Router market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
