Abstracts

A load sensing valve is found on a braking system of a car or a truck. It detects ,by way of a connecting rod; the weight or downward movement of a vehicle caused by a heavy load and allows more brake fluid/air/pressure to be applied to the rear brakes.As a vehicle moves forward,the front brakes do most of the work.The reason for this valve is to re-distribute the braking efficiency and make the vehicle more controllable under braking with a heavy load and give a more equal braking force,rather than the usual 60/40 split between front and back brakes.
