The global Locomotive Electric Traction Engine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An electric traction engine, also known as an electric locomotive or electric train, is a type of vehicle that uses electric power for propulsion. It is commonly used in railway systems for transporting passengers and freight. Electric traction engines offer several advantages over traditional diesel or steam locomotives. They are more energy-efficient, produce lower emissions, and provide smoother acceleration and deceleration. Additionally, electric traction engines can take advantage of regenerative braking, where the energy generated during braking is fed back into the power supply system, improving overall energy efficiency. Electric traction engines are widely used in urban and suburban railway systems, high-speed trains, and metro systems. They are also gaining popularity in freight transportation, where electric locomotives are used to haul heavy loads over long distances.
