Abstracts

The global Locomotive Inverter market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A locomotive inverter is a type of power electronic device used in electric locomotives to convert DC (direct current) power from the locomotive's traction batteries or overhead catenary system into AC (alternating current) power for driving the traction motors. The locomotive inverter is responsible for controlling the speed and torque of the traction motors, which are used to propel the locomotive. It converts the DC power into three-phase AC power at variable frequencies and voltages, depending on the desired speed and load conditions.
