Long-acting erythropoiesis-stimulating agents (ESAs) are medications designed to stimulate red blood cell production over an extended period, reducing the frequency of administration compared to traditional ESAs. These drugs, such as darbepoetin alfa and methoxy polyethylene glycol-epoetin beta, are modified to have a prolonged half-life, allowing for less frequent dosing?typically once every two to four weeks?while maintaining their effectiveness in treating anemia. Long-acting ESAs are commonly used to treat anemia related to chronic kidney disease (CKD) and chemotherapy-induced anemia.
