Long-acting polypeptide fatty acid side chains are a technology that extends the half-life of polypeptide molecules in the body by introducing fatty acid side chains into them. By binding to polypeptides, fatty acid side chains can increase their affinity with plasma proteins (such as albumin), reduce renal clearance, and thus prolong the existence time of polypeptides in the blood. This modification technology is widely used in the development of long-acting drugs, such as polypeptide drugs for the treatment of chronic diseases such as diabetes and obesity, to reduce the frequency of medication and improve patient compliance and treatment effects.
