Abstracts

The global Long-chain Aliphatic Diols market size is expected to reach \$ 113 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

Long-chain aliphatic diols refer to aliphatic diol monomers with a carbon chain length typically in the C8-C18 range and two hydroxyl groups located at or near both ends of the molecule. Long-chain aliphatic diols are fine chemical monomers that combine bifunctional reactivity with flexible long aliphatic chains. They can be incorporated into polymers and functional molecules through esterification, urethane formation, carbonate formation and acrylation, improving flexibility, hydrolysis resistance, low-temperature performance, hydrophobicity, chemical resistance and tactile properties. In 2025, global long-chain aliphatic diol sales is estimated at around 6,500 tons, with an average selling price of approximately USD 12,000 ton. The long-chain aliphatic diol value chain consists of upstream castor oil, bio-based long-chain alkanes, long-chain dicarboxylic acids, long-chain dimethyl esters, hydrogen and hydrogenation catalysts.

Demand for long-chain aliphatic diols is mainly driven by upgrades in high-performance polyester and polyurethane materials, substitution by bio-based specialty monomers, expansion of UV-curable materials, and growing demand for fine intermediates in flavors, fragrances and pharmaceuticals. As coatings, adhesives, elastomers, electronic chemicals and specialty resins require better flexibility, hydrolysis resistance, low-temperature performance, hydrophobicity and low-VOC characteristics, long-chain diols continue to gain value as bifunctional monomers capable of introducing long aliphatic segments into high-end formulations.

This report studies the global Long-chain Aliphatic Diols production, demand, key manufacturers, and key regions.
