Abstracts

The global Long-Chain Polyamides market size is expected to reach \$ 3849 million by 2032, rising at a market growth of 3.5% CAGR during the forecast period (2026-2032).

Long-chain polyamides, often referred to as long-chain nylons, are polyamides with 10 or more carbon atoms in their repeating units. These polymers are characterized by a low amide bond density, resulting in lower water absorption, better dimensional stability, and enhanced ductility compared to their shorter-chain counterparts. Examples include PA610, PA612, PA1012, and PA12.

Technological breakthroughs and domestic substitution are accelerating

Breakthrough in high-end material technology barriers: Huitong Co., LTD. 's PA612 material has a melting point of 215?, has passed the certification of new energy vehicle manufacturers and achieved batch supply, breaking the overseas monopoly. Wanhua Chemical's 40,000-ton/year PA12 production capacity has become the first industrialized project in China, with the butadiene synthesis method quoted at 53,500 yuan per ton.

Research and development of bio-based materials: The proportion of green materials such as castor oil-based PA11 and PA1012 has increased.

The application scenarios continue to expand

The core components of new energy vehicles: The penetration rate of PA12 in battery coolant pipelines exceeds 70%, and the application proportion of PA12 in European automotive hoses is over 50%.

Energy storage and hydrogen energy systems: The demand for long-chain nylon in the inner liner of hydrogen storage bottles and liquid cooling pipelines is increasing by more than 15% annually, and its resistance to ethylene glycol hydrolysis has become a key technical factor.

The lightweighting of automobiles (with a 35% weight reduction target by 2030) and the demand for wind power equipment will become the core growth drivers of the long-carbon chain nylon market.
