Abstracts

According to our (Global Info Research) latest study, the global Long Glass Fiber Reinforced PPS market size was valued at US\$ 127 million in 2025 and is forecast to a readjusted size of US\$ 185 million by 2032 with a CAGR of 5.7% during review period.

Long glass fiber reinforced PPS is a high-performance composite material made by modifying high-temperature resistant specialty engineering plastic PPS with the addition of long glass fibers. It combines the excellent heat resistance and corrosion resistance of PPS with the extremely high rigidity and impact resistance provided by the long glass fibers.

The core upstream raw materials are PPS resin, alkali-free glass fiber roving, and compatibility/coupling agents. The PPS resin determines the material's heat resistance, flame retardancy, chemical resistance, and basic flowability, typically requiring high purity and stable molecular weight. The long glass fibers determine the reinforcement efficiency, impact toughness, and warpage control, and are crucial in terms of fiber diameter, sizing agent system, and interfacial bonding with the PPS melt. Due to the high melting point and processing temperature of PPS, the requirements for glass fiber impregnation and resin thermal stability are higher than for ordinary PP/PA long glass fiber systems, thus narrowing the raw material and process windows. The midstream involves long fiber impregnation, pultrusion, cool pelletizing, and modified formulation control; the downstream mainly targets heat-resistant, chemical-resistant, high-rigidity, and lightweight structural components.

Global sales are projected to reach approximately 15,000 tons in 2025, with the mainstream ex-factory price averaging around US\$8,200 per ton. The gross profit

margin of major producers in the industry is estimated at 25%-40%.

Long glass fiber reinforced PPS is a niche, high-end category within high-performance LFT materials. Demand is primarily driven by automotive electrification, thermal management system upgrades, metal replacement, increased heat and flame retardancy requirements in electronics and electrical equipment, and lightweight industrial equipment. Compared to short glass fiber PPS, it is more suitable for load-bearing or semi-load-bearing components in terms of impact strength, creep resistance, dimensional stability, and low warpage. However, it is more expensive, has a narrower processing window, and demands higher standards in mold design, fiber retention length, and injection molding processes. Therefore, it will not achieve the widespread adoption of ordinary glass fiber reinforced PPS.
