Abstracts

Long-haul dark fiber refers to unused or unlit optical fiber cables laid over long distances, typically spanning hundreds or thousands of miles. Unlike lit fiber, which is actively transmitting data signals, dark fiber is 'dark' because it is not currently in use. This infrastructure is often installed by telecommunication companies, internet service providers, or network providers to meet future bandwidth demands or to provide redundancy in their network infrastructure.

Dark fiber can be leased or purchased by other companies or organizations for their own network needs. By leasing dark fiber, companies can have more control over their network capacity, performance, and security. It allows them to deploy their own networking equipment and protocols, giving them the flexibility to scale their network according to their specific requirements.

According to our (Global Info Research) latest study, the global Long-Haul Dark Fiber market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
