According to our (Global Info Research) latest study, the global Loss of Resistance (LOR) Syringe market size was valued at US$ 120 million in 2025 and is forecast to a readjusted size of US$ 168 million by 2032 with a CAGR of 4.9% during review period.

A Loss of Resistance (LOR) syringe is a specialized medical instrument used primarily during epidural and spinal anesthesia procedures. It features a unique design intended to help anesthesiologists or healthcare providers identify the correct placement of an epidural or spinal needle. The syringe typically contains air or saline, which when injected, helps the provider detect changes in resistance as the needle enters the epidural or spinal space. This change in resistance, often felt as a sudden loss or decrease in resistance, indicates entry into the desired anatomical space, facilitating accurate placement of anesthesia or analgesia medications. The LOR syringe is a critical tool in ensuring safe and effective regional anesthesia procedures, enhancing patient comfort and minimizing procedural complications.
