Louver controller is an electronic device used to control the operation of louver. Louver is a common ventilation system in buildings. Louvers are usually made of horizontal Flat noodles or blades that can be adjusted to control airflow through the building ventilation system. The louver controller allows building managers to adjust the louvers automatically, which helps improve energy efficiency and indoor air quality. The shutter controller is usually composed of a microprocessor-based control unit and a set of sensors, which can detect changes in temperature, humidity and airflow. The control unit uses this information to adjust the position of the louvers and ensure that the appropriate amount of air flows through the ventilation system of the building. Some shutter controllers also have built-in timer and scheduling functions that allow the building administrator to program the system to adjust the shutter according to the time or occupancy level of the day.
